

Brandon System Owner Guide

Opening check

1. Run `pnpm monitor-production` and confirm 9/9.
2. Check `/api/health/ready` for database, capture, notification, and Push readiness booleans only.
3. Review Lead Center unassigned, HOT, overdue, notification-failure, and action-queue views.
4. Check the WordPress bridge panel: Form 3 only, last success, pending retry, rejected form IDs, and duplicate legacy notification state.
5. Confirm test leads are suppressed and excluded from ordinary reports.

Closing check

1. Reconcile WordPress and Neon with `pnpm reconcile-wordpress-leads` using the approved secure environment.
2. Run `pnpm check-lead-sla`; escalate every genuine exception.
3. Review Vercel Production errors, GitHub scheduled monitor, and the hourly SLA cron.
4. Record only counts and correlation IDs in the operating scoreboard; never export raw PII into shared artifacts.

Controlled changes

- Forms: export definition/settings first, activate one allowlist ID, run one unmistakable suppressed QA, prove one record/alert/replay, and roll back only that form on failure.
- Users: provision only a verified roster identity; apply least privilege; revoke sessions on role/deactivation/lost device; keep break-glass access private.
- Web Push: apply reviewed schema/code, enroll one named physical device, send one [TEST], verify protected deep link/duplicate/revocation, and never record endpoint values.
- Secrets: enter only through Neon/Vercel/host secure interfaces. Never paste, screenshot, log, document, or commit a value.

Incident priority

- Critical: readiness/database/canonical-write failure, authentication bypass,

genuine lead loss, or duplicate live lead.

- High: failed internal notification, unassigned genuine lead, SLA breach, bridge rejection spike, or unsuppressed test.

- Warning: social preview regression, invalid-submission spike, delayed queue, or monitoring delay.

Use `ROLLBACK_GUIDE.md`, preserve durable records and evidence, and never resend a genuine lead by creating a second lead.
