

Emergency Rollback - One Page

Use the narrowest control. Preserve every genuine lead and all audit evidence.

Incident	Immediate action	Verify
One WordPress form	Remove only that Form ID from the bridge allowlist; restore only its proven duplicate local copy.	Local notification remains; no new canonical forward.
Global bridge	Set bridge mode disabled without deleting plugin data or entries.	WordPress forms still store locally.
Plugin regression	Restore the checksummed plugin/config backup.	Form 3 health and signature behavior.
Notification incident	Pause canonical notification processing; do not disable lead storage.	Queue visible; no lost lead or duplicate send.
RBAC incident	Set LEAD_CENTER_RBAC_ENABLED=false and redeploy.	Anonymous /admin returns 401; approved Basic fallback works.
Site incident	Redeploy last verified Vercel commit.	Live, ready, public routes, funnel, isolation.

After every rollback: run the production monitor, reconcile queue/lead state, confirm no lead loss, assign the incident owner, and preserve the failed evidence. Never expose secrets in an incident report.
